Dear Hiring Team,

Translating GenAI from lab-grade prototypes into measurable commercial impact for Life Sciences clients demands a rare blend — hands-on depth in agentic AI and LLM engineering, consulting delivery discipline, and fluency in pharma commercial domains like pricing, market access, and sales force effectiveness. Over the past decade I have been building exactly this combination — from foundational pharma analytics consulting at ZS Associates through to leading the enterprise GenAI build-out at Merck Healthcare, where agentic AI systems I established are now live across markets and used by over 10,000 people.

Designing and delivering GenAI solutions across Pricing, Market Access, and Commercial. At Merck I established the flagship Agentic Marketing Mix Modelling programme — a board-level priority now live in 5 markets, reducing commercial marketing spend by approximately 30% per market through a fully in-house multi-agent system with orchestration, memory, retrieval, and human-in-the-loop controls. This is agentic AI applied directly to the pricing and commercial optimization challenges Simon-Kucher's Life Sciences clients face. Separately, I designed and launched the enterprise RAG and LLM agent platform adopted by more than 10,000 internal users globally, generating over EUR 1.5M in savings and contributing approximately 12% EBIT uplift in key EU markets across a portfolio of 11+ solutions spanning commercial, market access, and medical affairs.

Consulting DNA meets enterprise AI leadership. My career began at ZS Associates, delivering commercial analytics consulting for global pharmaceutical clients across incentive compensation, sales force effectiveness, and market access — the same commercial domains Simon-Kucher serves. Having worked on both sides of the consulting table, I bring the structured problem-solving and stakeholder management required for client delivery, alongside the enterprise-scale AI architecture experience required to make solutions production-ready. At Merck I operate as a trusted advisor to executive stakeholders — pitching and securing sponsorship for AI programmes and building cross-functional delivery teams of 30+ across internal staff and external partners.

Hands-on GenAI and agentic AI depth. The role asks for hands-on expertise in LLMs, embeddings, prompt engineering, fine-tuning, and agentic AI systems. I fine-tuned a 31B-parameter domain model through supervised training, preference alignment (DPO), and reinforcement learning (GRPO), winning 59% of blind, judge-scored evaluations against a leading frontier model. I operate Merck's on-premises GPU cluster for AI workloads and serve a production fleet of frontier open-source LLMs. I defined and enforced the MLOps and LLMOps standards across the AI lifecycle — deployment, monitoring, observability, vendor capability evaluation, and governance for emerging agentic AI. This is hands-on work, not oversight of teams doing it.

Why Simon-Kucher Munich, and why now. Munich is my home, and the convergence of GenAI maturity, Life Sciences commercial transformation, and Simon-Kucher's growth agenda in digital consulting makes this the right moment. I have also served as an external advisor to Microsoft and Anthropic on the developer experience of their AI tooling, representing the pharmaceutical industry's enterprise-AI perspective — a vantage I believe could inform the thought leadership and capability building the role demands.

I would welcome the conversation about how this experience translates to client impact at Simon-Kucher.

Kind regards,

Aman Khan
